MQAM system

May 17, 2017

MQAM system is a complex block of code that simulates the modulation, transmission and demodulation of an optical signal using M-QAM modulation.

It is composed of four blocks: a transmitter, a receiver, a communication channel and a block that performs a Bit Error Rate (BER) measurement. The schematic representation of the system is presented in figure 1.

MQAM transmitter

A complete description of the MQAM transmitter either block by block or as a whole can be found in the *lib* repository.

This block generates one or two optical signals. It also generates a binary signal that is used to perform a BER measurement.

MQAM receiver (homodyne receiver)

A complete description of the MQAM transmitter either block by block or as a whole can be found in the *lib* repository.

The MQAM receiver is a homodyne receiver. It accepts one input optical signal and outputs a binary signal. It performs the M-QAM demodulation of the input signal.

BER measurement

Input parameters

The input parameters of the system are the ones from the MQAM transmitter plus the ones from the MQAM receiver.
